

July 2017 Sky Events – the Planets

Conjunction of Venus with a Crescent Moon

On the mornings of **Wednesday, July 19th, through Friday, July 21st**, the waning crescent **Moon** appears to glide past the planet **Venus** and provides appealing conjunction of two very bright celestial objects.

Look to the east about 6:00 a.m. EDT to locate the pair, which are easily outshining the red giant star **Aldebaran** – the “eye” of the bull in the constellation Taurus.
