

June 27th 2018 – the Planets

Conjunction of the Full Moon with Saturn

Reaching **opposition** on June 27th (located opposite the Sun as seen from Earth and its closest approach of the year), **Saturn** will celebrate this annual orbital milestone by closely joining a near Full Moon.

On the evening of **Wednesday, June 27th**, these two objects will be separated by just 1 degree, but don't be fooled by their proximity in the sky – on this night Saturn lies nearly **841 million miles** more distant than the Moon!
