The Zodiacal Light

- ★ October is one of the opportune months for finding the elusive “zodiacal light” in the early morning sky.
- ★ But what is zodiacal light?
- ★ Zodiacal light is the sunlight reflected from numerous dust grains located along the plane of the solar system → the ecliptic or “zodiac”.
- ★ These dust grains are left over from the formation of the solar system (a type of cosmic dust), and their supply is continuously fed by particles from comets and asteroid collisions.
- ★ The ecliptic is nearly vertical to the horizon this month, providing fine viewing opportunities.

The Zodiacal Light

- ★ Zodiacal light is seen as a “**cone**” of light that is widest at the horizon.
- ★ Look for it **low in the east** (with an unobstructed view) beginning about two hours before sunrise.
- ★ The **40-minute prime viewing window closes** about **80 minutes** before sunrise.
- ★ Pick a **very dark location** far from artificial lights and **without moonlight**.
- ★ The best dates, without moonlight this month, to see the zodiacal light will be **from October 9th–22nd**.
- ★ In this fall season, when the zodiacal light is visible in the eastern morning sky, it is often called the “**false dawn**”.
