

April 2019 Sky Events

2 Fly-overs of the International Space Station

During evening twilight on the nights of **Apr. 8th & 10th**, look for a bright flyover of the ISS in our region. The ISS should be easily visible for several minutes by most observers during dusk, as it reflects sunlight toward Earth. Watch it as it rises in the NW skies, crosses overhead at 17,500 mph, and then disappears into the Earth's shadow before reaching the SE horizon.

For folks with a clear open sky to the horizons, these ISS passages should be visible for 2 to 4 minutes.

For the precise flyover timing and a great location chart of the ISS positions during these events, try these links:

[Apr. 8](#); [Apr. 10](#).
