

January 2021 Sky Events

Seven Bright Flyovers of the International Space Station

During evening twilight and early nightfall on the seven evenings of **January 16-22**, look for a bright flyover of the ISS in our region. The ISS, orbiting at an average altitude of 250 miles and travelling at 17,500 mph, should be easily visible for several minutes by most observers, as it reflects sunlight toward Earth. Careful observation will show that many of these ISS flyovers disappear into the Earth's shadow before reaching the horizon.

For folks with a clear open sky to the horizons, these ISS passages should be visible for 2 to 4 minutes or longer.

For the approximate flyover timing and a great location chart of the ISS positions for the Asheville area during these events, navigate to the desired date at this [link](#).
