

## The Harvest Moon Glides Past Saturn

The waxing gibbous Harvest Moon glides below the gas giant planet Saturn in the constellation Aquarius, on the night of **September 26<sup>th</sup>**. This year the Harvest Moon is “full” on the night of Sept. 28/29.

Contemplate that Saturn is located some 828 million miles (or 74 light minutes) behind the Moon.

On these late September nights, with a view low to the eastern horizon, look also for the rising of the bright gas giant planet Jupiter around 9:30 p.m. EDT.
