

The Beaver Moon Joins Saturn in the Constellation Aquarius

On the night of **November 1st**, a waxing-gibbous Beaver Moon “visits” the gas giant planet Saturn in constellation Aquarius, the Water Carrier. This year the Beaver Moon is “full” on the night of November 5th.

Joining the show to the left of Saturn, in the constellation Pisces, the Fishes, is the faint 7th planet of our solar system, Neptune. You will need binoculars or a small telescope to observe Neptune’s pale blue disk.

Saturn, our planetary “lord of the rings”, is located some 818 million miles (73 light minutes) behind the Moon, and it’s in excellent position for telescopic observation.
